

David Suzuki Foundation - A Report on the Environment and Climate

Policies, nature and community action provide powerful climate solutions.

A new study shows how carbon pricing and renewable energy subsidies have significantly reduced emissions worldwide.

Researchers discovered that tree bark helps remove methane from the atmosphere, so reforestation could be vital in meeting global methane reduction goals. Energy research shows how more electricity sharing strategies could drastically reduce outage risks while bolstering support for renewables. And a small group of Benedictine nuns is using their investments to push companies to change harmful policies.

Together, let's continue to strive for a future filled with hope, innovation and sustainable solutions.
